

## **Assignment 5: Sketches2**

Jaume Benseny

### Sketch 1 – Appealing

The process of defining the subset is longer than in sketch 2. The fact that has more steps doesn't necessary imply that is simpler to operate.

#### **Pros**

- Interfaces are minimal, minimum “ink” displayed
- High level of detail when querying (building subset with subcategories)

#### **Cons**

- Due to the lack of guidance, user may not understand what to do
- To use subcategories increases the complexity of metadata and its related classification

### Sketch 2 – Simplified query

Subsets are defined in fewer steps and can be readjusted easily.

#### **Pros**

- Interfaces are self-explanatory (use of silhouettes)
- Query is super simple (part of the body + weather)
- Subset / query can be readjusted any time with lateral and weather bar

#### **Cons**

- To display lateral and weather bar at all interfaces make them seem dirty and over charged.
- It's not as appealing as sketched1 even though it's more effective when user gets familiar with the mechanics.
